Abstract : The endothelial cells possess a tremendous plastic adaptability to stretching in any direction. Closing striae (CS) occur during coagulation of the fluid, oozing out from the interendothelial spaces, and represent inconstant formations, undergoing a continuous process of wear and renewal. The CS separate matter in the vascular lumen from the tissue fluid and are endowed

Title : The Morphological Nature of Resorptive Cells.

Orig Pub : Ceskosl. morfol., 1956, 4, No 3, 239-255

Abstract : The process of resorption has been studied on yolk sac cells of rodents and on human chorion. It was found that the process of resorption proceeds in four stages:  
1) penetration of compounds through the surface cell membrane,  
2) through its intracellular media,  
3) through the mitochondria apparatus (Golji's apparatus)  
4) passing into the subepithelium tissues. The second stage is of greatest interest. The morphological substrate of the resorption in the first state is a brush-like border consisting of plasmotic protuberances which

Card 1/2

B-3

Abs Jour : Ref Zhur - Biol., No 15, 1958, 66696

increase the resorptive surface manyfold. The morphological substrate of the second stage consists of adsorbing bodies which are located in vacuoles and which are stained by Neutral Red. The lipoproteins in those bodies adsorb the entering substances, thus decreasing their concentration in a cell. It was established that adsorbing bodies are vividly colored not only with alkaline but also with the acid dyestuffs.

2932. WOLF J., JANOUTEM V., KLIKOU E., MYSLİVEČKOVOU A., TITLBACHEM M. and ZASTAVOU V. Úst. pro Histol. Lék. Fak. Karlovy Univ., Praha. Regulační mechanismus průtoku krve velkými kmeny věnčitých tepen člověka a dedukce z něho vyplývající *The regulating mechanism of blood flow in the main branches of the coronary arteries in man and deductions following from it* Čas. Lék. čes. 1956, 95/36 (973-981) Illus. 11.

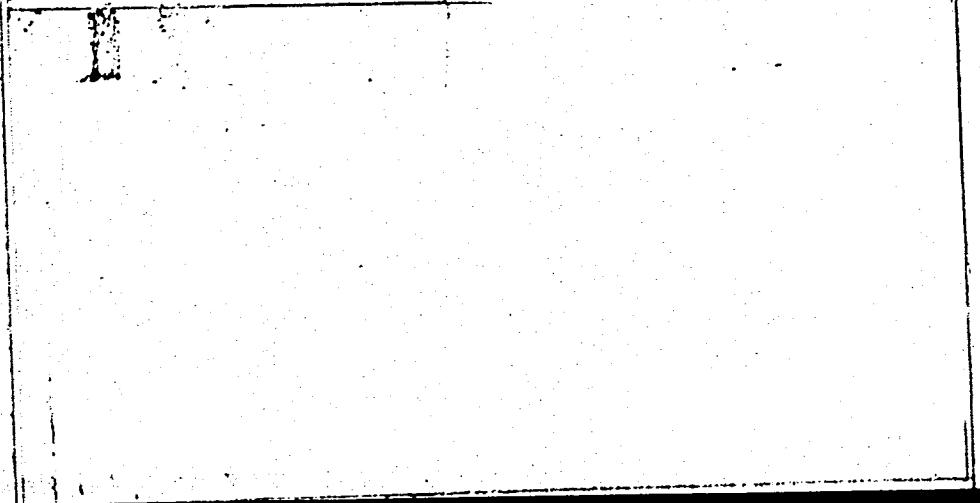

The comparative study of microscopic preparations revealed the fact that on the lowering of the muscle tonus in the media by 1/10 of the length of the muscle cell the blood flow rises to 181.1%. Shortening of the muscle cells of the media by 1/10 of their length results in a lowering of the blood flow down to 47.2%; when the shortening of the muscle cells of the media reaches 37.28%, the flow stops altogether. The authors believe that under pathological conditions where the intima is 1.3 the thickness of the media, its resistance becomes affected so as to 'gather' under the impact of the blood flow. The intima is stripped off along the longitudinal axis of the artery. In normal individuals, this stripping is prevented partly by the passive resistance of elastic and collagenous fibres, partly by the active tonus of the muscle cells distributed throughout the intima. An important aspect of the pathology and therapy of the coronary arteries lies in the realization that even a very slight reduction in the length of the muscle cells may altogether interrupt the blood flow and thus lead to death. The cases of infarction where not even a very careful autopsy revealed an occlusion in the artery, must be explained as consequent to a spasm of the muscles. In these cases irritation of the artery may be caused by a dislodged atheromatous bed (plaque). The thickening of the intima in the process of ageing impedes its nutrition and assists in producing atheromatous changes. These changes affect the tonus and elasticity of the arterial wall, and the intima gets "stripped off" by the blood flow. The irritation caused in this way brings about spasms which may become manifest in the form of anginous attacks or infarctions, without the autopsy revealing any arterial occlusion.

Karlovy Univ., Praha - ČSL. MORFOL. 1957, 5/4 (410-420) Illus. 27

On the surface pattern of the conjunctival epithelium, which was demonstrated with  
the author's moist relief method, the basic pattern of the superficial cover cells  
and their secretions can be distinguished. The pattern was examined both optically  
and by electron microscopy. The basic pattern of the superficial cover cells shows  
a finely lobular structure. Especially at the surface of the fornix epithelium this  
structure is deep to villous. Signs of secretory activity of epithelial cells are de-  
scribed. (I, 12)

741. Hypertrophy of the left ventricle in athletes Beitrag zum Studium der Linkskammerhypertrophie bei Sportlern. WOLF J. and KARFA H. Prague XIe Congres Intern. Med. sport à Luxembourg du 30 mai au 3 juin 1956 (594-602) Graphs 10 Tables 1

Twenty athletes with left ventricular hypertrophy were submitted to ECG examination after a combined effort test comprising the glucose test, orthostatism and knee-bendings. The authors' results are compared with corresponding results obtained by other authors in hypertensive patients with left ventricular hypertrophy. The conclusion is reached that myocardial hypertrophy in athletes and in hypertensive patients differs only quantitatively and not qualitatively.

2763. THE IMPORTANCE OF INCOMPLETE RIGHT BUNDLE-BRANCH BLOCK  
(TAWARA) IN ATHLETES - Význam nedoplň blokády pravého raménka.

Tawarova u sportovcu - Wolf J. Odd. Zdravotní Péče o Tělo. Výchova a Sport ÚNZ-ÚNV, Praha - ČAS. LÉK. CES. 1958, 97/22 (681-689) Graphs 13  
Among 422 ECG curves from athletes, 70 cases of partial RBBB were found.  
Clinical history or state did not explain the occurrence of this finding. Only in one case was there thoracic deformation seen. In certain cases, during follow-up, these changes either improved or worsened. The presence of this change depended on the degree of intensity of training and participation in exhausting events. It was possible to influence this ECG picture of RBBB by a Valsalva manoeuvre, and the author concludes that the block is functional. Its basis should be sought for in diastolic overfilling of the right ventricle as a result of the haemodynamic changes developing in the course of training and racing. (XVIII, 6)

AUTHORS: Wolf, Jindrich, Wolf, Jindrich

TITLE: The effect of the velocity of metal in the feeder on the mechanical properties of pressure-cast samples

PERIODICAL: Referativnyy zhurnal, Tekhnologiya mashinostroyeniya, no. 4, 1963, 44, abstract 4G272. (Slévárenství, v. 10, no. 8, 1962, 289 - 295) (Czech.; summaries in Russian, German, English, and French)

TEXT: The effect of the rate at which the mold is filled with metal on the mechanical properties of samples cast from the 42 4331.03 Czech standard alloy was studied. The investigation was carried out on a CLP85/15 - 3 machine with a vertical pressing chamber. When preparing the samples the plunger stroke, the time of its travel and the force produced by the machine were measured with oscillographic and tensiometric equipment. The velocity of metal in the feeder was computed by the speed of the plunger. It has been established that with an increase of the velocity of metal in the feeder all mechanical properties of the samples improve as well as the

621.313.52.017.7  
#72. Measurement of the temperature rise of  
synchronous machines on no-load and short-circuit.  
R. WOLF: Elektroteh. Vestnik, 21, No. 5-6, 151-7  
(1953). In Serbo-Croat.

The temperature rise of the windings of synchronous machines may be determined with rough approximation by adding the rise measured on no-load and on short-circuit. However, an analysis of the actual heat dissipation conditions of the machine based on a simple overall diagram shows that inaccuracies arise and where. Corrections may, however, be introduced which make the superposition method more satisfactory. Non-uniformity of the temperature distribution in the windings has little effect on the results, nor have the differences in the temperature distribution in different test conditions an appreciable influence. The variation of the resistivity of the conductors with the temperature must therefore be considered. Field losses must also be taken into account. These two factors are easily calculated. Furthermore, the error introduced by the temperature rise of the cooling air in the fan or by the temperature drop in the circulation cooler must be corrected. The variations of the thermal conductivities and heat transfer coefficients of various parts of the machine with the temperature are, however, impossible to estimate. Another factor which cannot be assessed is the variation of the heat losses of the stator teeth due to field distortion under load for the corresponding temperature variations. R. F. KILAVAN

WOLF, R.

The behavior of nascent ferric hydroxide sols was studied by J. S. and R. Wolf (Ucrt. Zagreb, Yugoslavia), *Arhiv Reca*, 23, 391-399 (1950; English summary); cf. C.A. 43, 1242e. Fe(OH)<sub>3</sub> sol was pptd. from solns. of  $4 \times 10^{-4}$  N FeCl<sub>3</sub>,  $1 \times 10^{-3}$  N HCl, and NaOH at varying concns. and the behavior of the nascent sol and of the system before and after formation of the sol was investigated with respect to turbidity in the green spectral region, electrophoretic mobility, and pH. This procedure furnishes the negatively charged sol; the positively charged one is prep'd. from  $5 \times 10^{-4}$  N NaOH, various amounts of FeCl<sub>3</sub>, and amounts of HCl roughly 1/100 of the amounts of FeCl<sub>3</sub>. The same factors were investigated. In the same way were observed the coagulation of  $4 \times 10^{-4}$  N FeCl<sub>3</sub> +  $7.8 \times 10^{-4}$  N NaOH +  $4 \times 10^{-4}$  N HCl by K<sup>+</sup>, Mg<sup>++</sup>, and La<sup>+++</sup> and of  $0.2 \times 10^{-4}$  N FeCl<sub>3</sub> +  $6.2 \times 10^{-4}$  N HCl +  $5 \times 10^{-4}$  N NaOH by NO<sub>3</sub><sup>-</sup> and SO<sub>4</sub><sup>2-</sup>; also the hydrolysis of FeCl<sub>3</sub> with roughly 1/10 the concn. of HCl, and the hydrolysis of Fe(NO<sub>3</sub>)<sub>3</sub> with about 1/10 the concn. of HNO<sub>3</sub>. The tyndallometric values of the pptn. curves show two max.: the isoelectric max. and the max. due to the coagulation effect of the added ion. The isoelectric max. is accompanied by a sudden change in the electrophoretic and pH curves. The coagulations, with a few exceptions, follow the Schulze-Hardy rule. 4% sucrose soln. stabilizes the system; coagulation by neutral salts does not change the electrophoretic curve appreciably. The hydrolysis of both FeCl<sub>3</sub> and Fe(NO<sub>3</sub>)<sub>3</sub> result in positively charged sols at certain concns. If a coagulation mixt. is prep'd., e.g.  $2 \times 10^{-4}$  N AgNO<sub>3</sub> +  $2 \times 10^{-4}$  N KBr +  $1.37 \times 10^{-4}$  N HNO<sub>3</sub>, then the coagulation value of Fe(NO<sub>3</sub>)<sub>3</sub> for nascent AgBr sol will increase slightly for certain solns. of Fe(NO<sub>3</sub>)<sub>3</sub> if these are not freshly prep'd. or have been heated for one hr. to 90°. This may indicate a decrease in valency owing to complex formation. Werner Jacobson

WOLF, R.

WOLF, R.

The precipitation processes as indicators for metathetic structures. The effect of mixtures of electrolytes, of solvents, and of colloid substances. Ilovo Tefak, E. Matijevic, K. Schulte, J. Kratolivil, R. Wolf, and B. Cernicki (Univ. Zagreb, Yugoslavia), *J. Colloid Sci.*, 1954, Suppl. 1, 118-27; cf. *C.A.*, 47, 6219f.—The characteristic max. and crit. limits encountered in detg. the aggregation of inorg. salts of low solv. In the presence of electrolytes can be used to obtain an insight into the structures of the metathetical (i.e., interboundary) layer between crystal and soln. Examples given are: (1) the antagonistic action of mixts. of La(NO<sub>3</sub>)<sub>3</sub> with KNO<sub>3</sub>, K<sub>2</sub>SO<sub>4</sub>, Mg(NO<sub>3</sub>)<sub>2</sub>, or MgSO<sub>4</sub> in the pptn. of AgBr or AgI sols; (2) the effect of dioxane on the ability of KNO<sub>3</sub>, Ba(NO<sub>3</sub>)<sub>2</sub>, and La(NO<sub>3</sub>)<sub>3</sub> to coagulate AgBr sols; and (3) the effect of small amts. of AgI on the pptn. of AgBr or AgCl sols.
